Bangladesh Water Development Board

Availability Report of Weekly Ground Water Level Data for 2017 & 2018

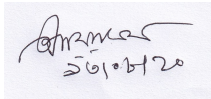

August 2020

Prepared & Published by:

**Ground Water Processing Branch
BWDB, 72 Green Road, Dhaka.**

Preface

Ground Water Processing Branch is responsible for data entry and archiving all the soft data which is receiving from two field divisions of Ground Water Hydrology. These two field divisions collect five types of Ground Water Hydrology related data. i.e Ground water weekly data, Ground water daily data, Ground water quality data, Pump test data and Lithology/Bore log data. After getting above data this branch check validation, quantity and quality of this data and finally preserve soft and hardcopy of this data. There are more than thousands of different types of station located all over the Bangladesh. Due to manpower and fund constraint it is not possible to collect data from all the stations. Every year a significant amount of data not come to processing branch and the exact amount are not identified. For this we are plan to make a report of availability of data for the year 2017 and 2018. In 2017 we had got 77.20% of data and in 2018 which was 80.69%. As this is the first time to prepare this type of report hope this may continue for future.

B.M. Abdul Momin

Introduction:

Bangladesh water development board plays an important role in crop production, river bank protection, flood management and help decision making for future planning. It has a strong hydrological network throughout the country for collecting different types of hydro-meteorological data. This data is used for planning, studying and research works and its help better management of water resources of the country. In dry session Bangladesh water development board take proper necessary steps for irrigation water supply which helps to bumper crops production and booming national economy. In rainy session it's protect life and property from floods & river erosion and also provides warning about flash flood, seasonal flood, flood danger level and approximate flooding period etc. Currently, BWDB carryout more than thousand of ground water hydrology stations and collects data of different frequencies such as daily and weekly basis. The observed data are then used to develop hydrograph and trend analysis of future ground water table. In this report we are trying to find out actual status of data availability of weekly ground water table data in 2017 & 2018.

Ground Water Hydrology:

Directorate of Ground Water Circle has two field divisions, Ground Water Hydrology division-I and Ground Water Hydrology division-II. They are responsible for collecting and monitoring ground water data and send these data to the Ground Water processing Branch. Ground water Processing Branch process and analyze mainly five kinds of ground water data.

- 1) Ground water weekly data,
- 2) Ground water daily data,
- 3) Ground water quality data,
- 4) Pump test data,
- 5) Lithology/ Bore log data.

Ground water weekly data:

Ground water weekly data is collected by Ground Water Hydrology division-I and Ground Water Hydrology division-II. Normally the data collected in weekly basis, send these data Ground Water Processing Branch. More or less 1327 stations of weekly basis is processed and preserved by Ground Water Processing Branch as regular work for the whole year.

Ground water daily data:

Ground water daily is collected from 23 stations. Data is collected in meter bellow the ground surface. All these data preserve, checking, analyze Ground Water Processing Branch.

Ground water quality data:

Ground water quality sample is collected from 117 stations two times of a year. These samples are analyzed in laboratory more than 20 parameters and generate huge amount of data. These data processed and interpretation by Ground Water processing section.

Pump test data:

Huge volume of pump test data is collected from two stations in every year. These data is collected by field division and send to the Ground Water Processing Branch. All types of analyzing activities, accuracy checking, interpretation and preserve them into the data base server done by Ground Water Processing Branch.

Lithology/ Bore log data:

Lithology data is preserving is regular work of Ground Water Processing Branch. The data is collected by field division and send to the Processing branch.

Data availability:

a) Data availability in 2017:

Ground water weekly data availability is collected from the data base server of Processing and Flood Forecasting Circle for the year 2017 and 2018. There are 1327 no's stations found in the data base server. In the year 2017 weekly data received from 1115 no's stations out of 1327 no's stations which represents that 84.02% of station's data receive in this period.

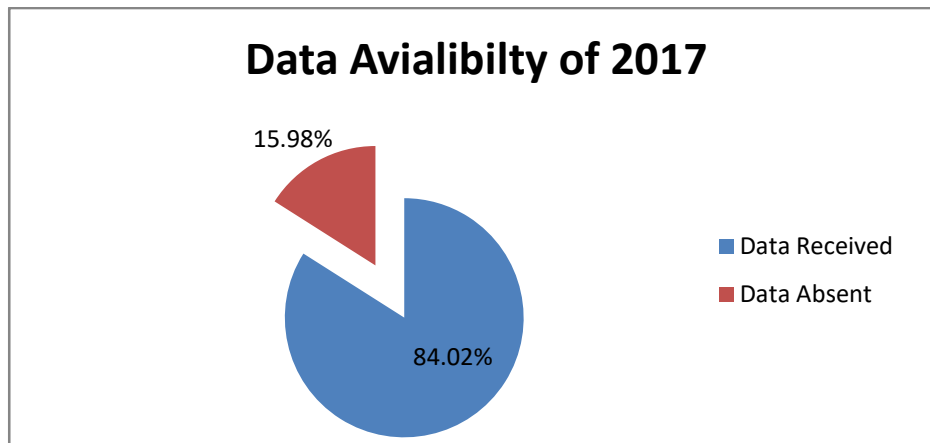

Figure-1: Weekly data availability of 2017 (Station).

Every month there is more or less 4 to 5 nos data are collect each station. From the availability of 2017 we see that all data of 1115 nos of stations are not received i.e a significant

amount of collected station's data not come to processing branch. In 2017 we had received 1115 nos stations data out of 1327 stations. Total expected data of 1115 stations are 57980 but we got 44760 nos data which represent 77.20%.

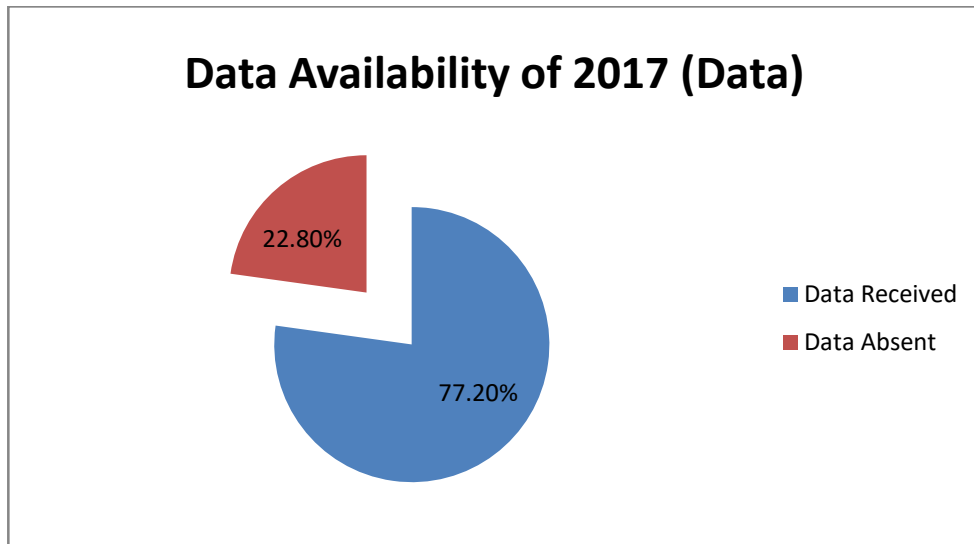

Figure-2: Weekly data availability of 2017 (Station).

For the year of 2017 the total expected data in January was 5575 but we got 4440 nos data which represent 79.64% data received in January, in February expected data was 4460 but we received 2914 which represent 65.3% data received in February, in March expected data was 4460 but we received 3621 which represent 81.2% data received in March, in April expected data was 4460 but we received 3662 which represent 82.1% data received in April, in May expected data was 5575 but we received 4413 which represent 79.2% data received in May, in Jun expected data was 4460 but we received 3437 which represent 77.1% data received, in July expected data was 5575 but we received 4324 which represent 77.6% data received in July, in August expected data was 4460 but we received 3280 which represent 73.5% data received, in September expected data was 4460 but we received 3411 which represent 76.5% data received, in October expected data was 5575 but we received 4352 which represent 78.1% data received, in November expected data was 4460 but we received 3540 which represent 79.4% data received, in December expected data was 4460 but we received 3366 which represent 75.5% data received. Total number of monthly data received in 2017 shown in appendix-I.

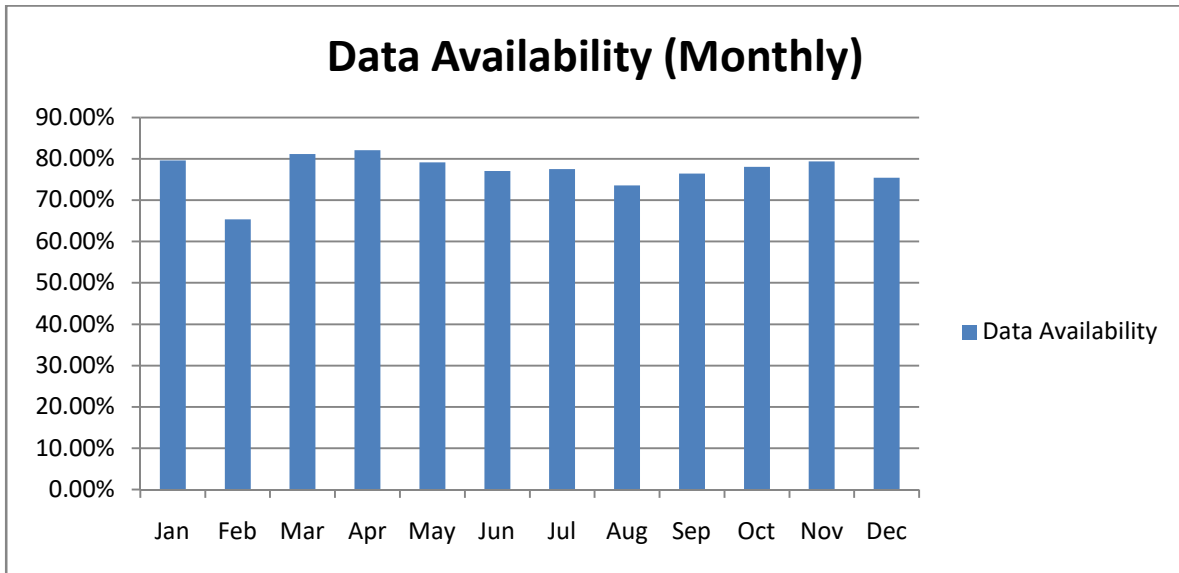

Figure-3: Percentage of data received January to December in the year 2017

From the above figure it is clear that the maximum amount of data received in April 2017 and lowest amount of data received in February 2017. In 2017 variation of the received data is 65.3% to 82.1%.

b) Data availability in 2018:

In the year 2018 ground water weekly data received from 1198 stations. The received data represent 90.28% stations and absent data are 9.72% stations.

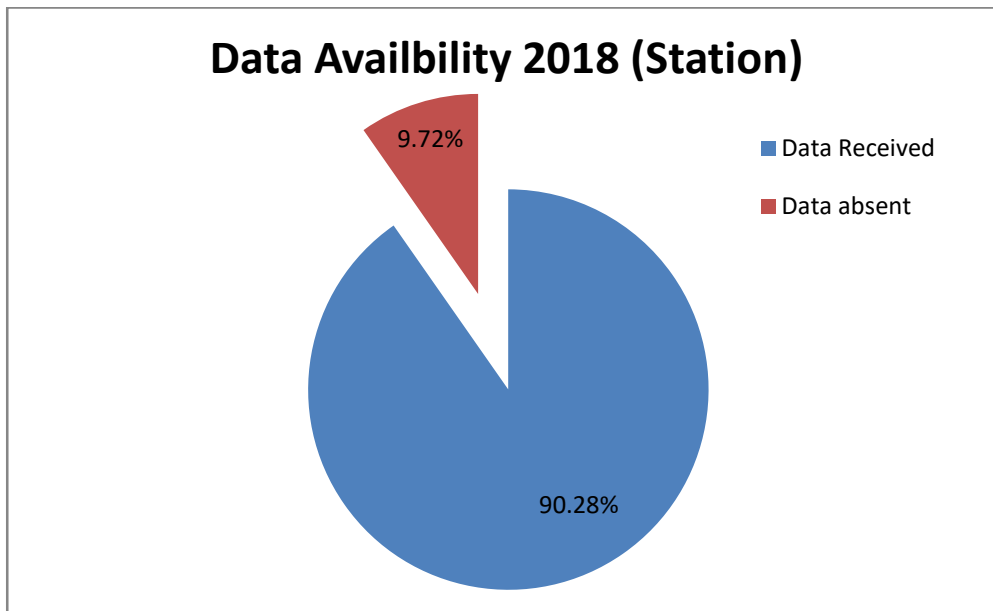

Figure-4: Weekly data availability of 2018 (Station)

From the availability of 2018 we see that all data of 1198 nos of stations are not received i.e a significant amount of collected station's data not come to processing branch. In 2018 we had received 1198 nos stations data out of 1327 stations. Total expected data of 1198 stations are 62296 but we got 50267 nos data which represent 80.69%.

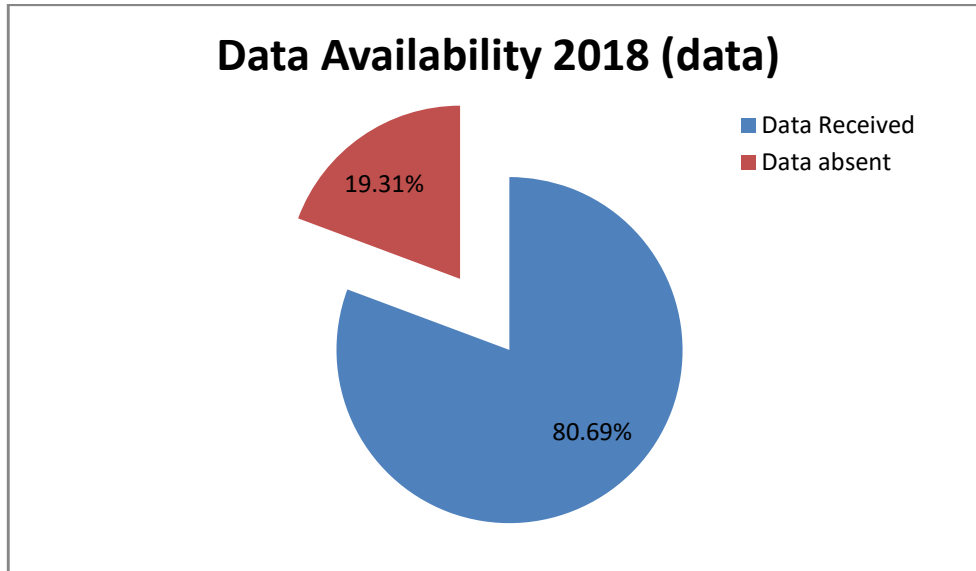

Figure-5: Weekly data availability of 2018 (Data)

In 2018 total data expected in January was 5990 but we got 5180 nos data which represents 86.48%, in February expected data was 4792 but we received 4101 which represent 85.58% data received, in March expected data was 4792 but we received 3804 which represent 79.38% data received, in April expected data was 5990 nos but we received 4633 nos which represent 77.35% data received, in May expected data was 4792 nos but we received 3680 nos which represent 76.79% data received, in Jun expected data was 4792 nos but we received 3735 nos that represent 77.94% data received, in July expected data was 5990 nos but we received 4546 nos that represent 75.89% data received, in August expected data was 4792 nos but we received 3768 nos that represent 78.63% data received, in September expected data was 4792 but we received 3725 that represent 77.73% data received, in October expected data was 5990 nos but we received 4712 nos that represent 78.66% data received, in November expected data was 4792 but we received 3740 nos which represent 78.05% data received and in December expected data was 5990 nos but we received data is 4643 nos which represent 77.51% data received. Total number of monthly data received in 2018 shown in appendix-II.

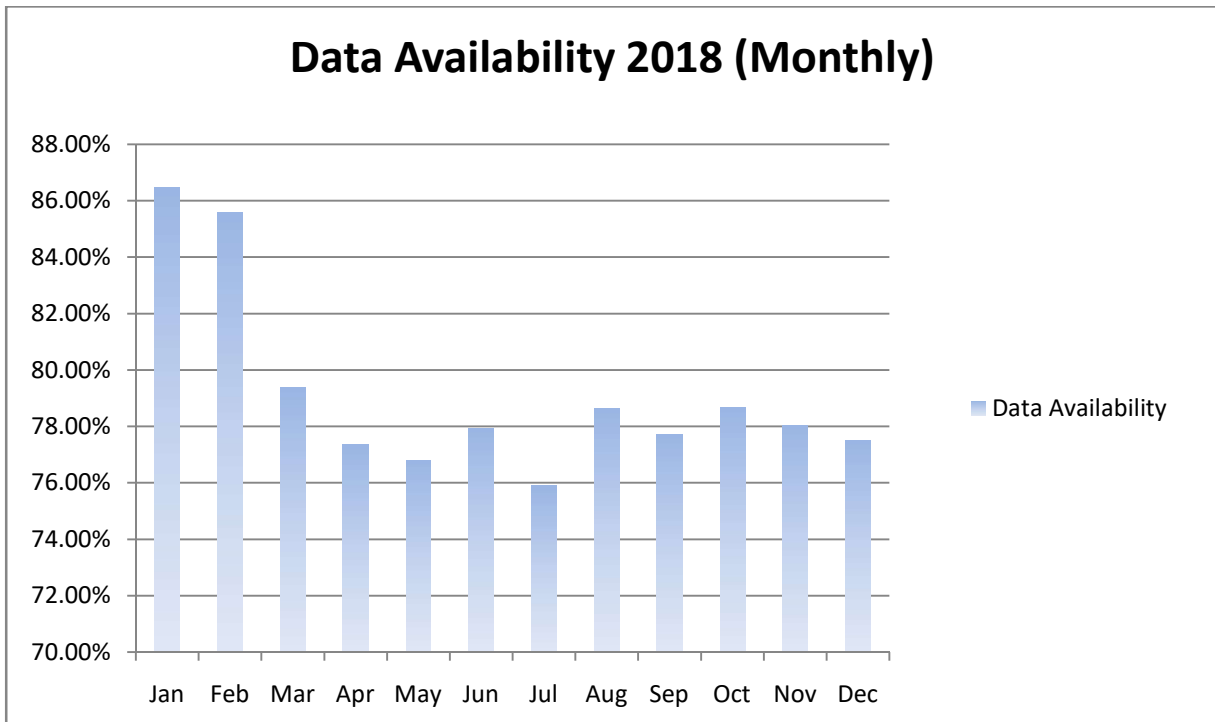

Figure-6: Percentage of data received January to December in the year 2018

From the above figure it is assume that maximum amount of ground water table weekly data received in January 2018 which represents 86.48% and lowest amount of ground water weekly data received in July 2018 and represents 75.89% of data. The average data received is varying from 86.48 to 75.89%.

Conclusion and recommendation:

From the above analysis it is clear that in every year significant amount of data we don't get from the field divisions. To properly maintain the data base server of BWDB and enhance reputation of board getting uninterrupted data is very important. A lack of data may hamper the planning, future study and trend analysis of ground water table. So, the concern authority should take necessary steps to improve the monitoring to get data regularly.

Weekly water level availability-2017
